

ISO 50001 Certification of Energy Performance

We certify systems for energy management, including energy efficiency, use and consumption

What is the ISO 50001 standard?

Reducing the carbon footprint of an organisation and improving its energy performance are key factors when defining the core strategy of an organisation. The UNE-EN ISO 50001 is an international standard that defines the systems and processes needed by an organisation to continuously **improve its energy performance, including its energy efficiency, use and consumption.**

The ISO 50001 standard promotes better practices and behaviours in energy management and provides a framework for improving energy efficiency throughout the entire supply chain.

Who can obtain the ISO 50001 certification?

Any organisation can implement and certify an energy management system under the UNE-EN ISO 50001 standard, irrespective of its type, size, or the sector in which they operate.

What does the ISO 50001 certification bring to a company?

Obtaining the UNE EN ISO 50001 certification of an energy management system helps organisations to assess and prioritise the introduction of new energy efficiency technologies. In addition, the companies that obtain the certification will be able to:

- Improve their energy efficiency, use and consumption.
- Be more transparent and facilitate communications about energy resource management.
- Improve the energy management of projects for reducing greenhouse gas emissions.
- Communicate to the market the efforts made to improve energy performance.
- Reduce their carbon footprint.

Why become the ISO 50001 certified with Applus+ Certification?

Applus+ Certification is an independent body of recognised prestige both at a national and international level. Our goal is to help organisations to fulfil their commitment to continuous improvement.

We analyse the needs of our clients in depth so our auditors can carry out the **best service possible when verifying compliance with the ISO 50001 standard.**
